WEEK 1 · DAY 3 · TASK 1

Capture a Live Cricket Score with Playwright

Assignment | learn. build. operate

1. Problem Statement

A live score is not in the page you download; it arrives afterwards, through JavaScript. **Playwright** drives a real browser, so it sees what you see. Write a script that opens **Cricbuzz**, waits for the latest score to appear, prints it, and saves a **screenshot**.

Tools: Python, Playwright

2. Requirements

- Keep all your code in a single file named `cricbuzz_score.py`.
- Use Playwright's **sync API** to open `cricbuzz.com`.
- Find the score element **yourself** by inspecting the page, do not guess a selector.
- **Wait for the element**, do not sleep for a fixed number of seconds.
- Print the score text to your terminal.
- Save a screenshot as `score.png`.
- Run it **headed** first so you can watch it work, then switch to headless and confirm it still does.

> **Think it through**
>
> A fixed `sleep(5)` works right up until the day the site is slow, and then it fails for no visible reason. What does Playwright give you instead that waits for the thing you actually need? And what should your script do when there is no match live at all, crash, or say so?

3. Steps to complete

These are hints, not the full answer. Find the selector yourself.

Step 1: Install Playwright

Two steps: the Python package, then the browsers it drives.

```
mkdir cricket-score && cd cricket-score
python -m venv venv
# macOS / Linux                    # Windows (PowerShell)
source venv/bin/activate           venv\Scripts\Activate.ps1
pip install playwright
playwright install chromium
```

Step 2: Find your selector first

Open Cricbuzz in your own browser, right-click the score and choose **Inspect**. Note the tag and class. Try it in the browser console with `document.querySelector("...")` before you put it in Python, debugging a selector in the console takes seconds, in a script it takes minutes.

Step 3: Write and run the script

```
from playwright.sync_api import sync_playwright

with sync_playwright() as p:
    browser = p.chromium.launch(headless=False)
    page = browser.new_page()
    page.goto("https://www.cricbuzz.com/")
    page.wait_for_selector(...)      # the selector you found
    score = page.inner_text(...)
    print(score)
    page.screenshot(path="score.png")
    browser.close()
```

4. Final output

```
$ python cricbuzz_score.py
IND 287/4 (45.2 Ov)
CSK vs MI - India need 24 runs in 28 balls

saved score.png
```

5. What to submit

- Your `score.png` screenshot of the live score.
- A screenshot of your terminal showing the score printed.
- Your `cricbuzz_score.py` on **GitHub**, link in **WhatsApp**, video in the **community**.
